

1. Is "Johann Sebastian Bach is the greatest of all the Baroque composers" a proposition? Explain.

Answer: Yes, the statement "Johann Sebastian Bach is the greatest of all the Baroque composers" is a proposition. A **proposition** is a declarative sentence that has a definite truth value (either true or false, but not both).

2. Write the negation of "Hikaru is taller than Yutaka":

Answer: Yutaka is as tall as or taller than Hikaru.

3. (a) Write the fully simplified negation of $3 < x \leq 4$:

Answer: $x \leq 3 \vee x > 4$.

- (b) Negate verbally: "all people weigh at least 100 pounds."

Answer: "There exists someone who weighs less than 100 pounds."

4. Is the conditional statement "If a human being has 7 heads, then they have 11 arms" true or false?

Answer: The conditional "If a human being has 7 heads, then they have 11 arms" is true. A conditional is false only if its antecedent is true and its consequent is false. Since no human being has 7 heads (the antecedent is never satisfied), there is no case that makes the conditional false, so it is true.

5. Rephrase in contrapositive form: "If you are taller than 6 ft, then it is unpleasant for you to travel in economy class."

Answer: If traveling in economy class is comfortable for you, then you are not taller than 6 ft.

6. Rephrase verbally in equivalent only if, sufficient, necessary, contrapositive and unless form: "if we had an FTL drive, then we could visit the stars".

Answer:

- **Only if:** “We could visit the stars only if we had an FTL drive.”
- **Sufficient:** “Having an FTL drive is sufficient for visiting the stars.”
- **Necessary:** “Visiting the stars requires an FTL drive.”
- **Contrapositive:** “If we could not visit the stars, then we did not have an FTL drive.”
- **Unless:** “We cannot visit the stars unless we have an FTL drive.”

7. Write the formal negation of $\forall x \exists y (x > y)$. Your negation must not contain any explicit negation symbols.

Answer: $\exists x \forall y (x \leq y)$.

8. Use logical equivalences to simplify $(p \rightarrow q) \rightarrow (\neg p \rightarrow \neg q)$ until you have at most one occurrence of each variable p ; q remaining. Identify all logical equivalences by name.

Answer: The expression $(p \rightarrow q) \rightarrow (\neg p \rightarrow \neg q)$ simplifies to:

$$p \vee \neg q.$$

Steps:

- (a) **Material Implication:** Rewrite the inner implications:

$$p \rightarrow q \equiv \neg p \vee q \quad \text{and} \quad \neg p \rightarrow \neg q \equiv p \vee \neg q.$$

- (b) Substitute into the original expression:

$$(p \rightarrow q) \rightarrow (\neg p \rightarrow \neg q) \equiv (\neg p \vee q) \rightarrow (p \vee \neg q).$$

- (c) **Implication Equivalence for the Outer Conditional:** Rewrite the outer implication:

$$(\neg p \vee q) \rightarrow (p \vee \neg q) \equiv \neg(\neg p \vee q) \vee (p \vee \neg q).$$

- (d) **De Morgan's Law:** Apply it to the negated part:

$$\neg(\neg p \vee q) \equiv p \wedge \neg q.$$

- (e) The expression now becomes:

$$(p \wedge \neg q) \vee (p \vee \neg q).$$

- (f) **Absorption Law:** Use it to simplify the expression:

$$(p \wedge \neg q) \vee (p \vee \neg q) \equiv p \vee \neg q.$$

9. (a) **Answer:** Each bit a_k can be reconstructed by computing:

$$a_k = b_k \text{ XOR } c_k.$$

- **Case 1 :** If $b_k = 0$ and $c_k = 0$, then a_k must be 0 because $0 \text{ XOR } 0 = 0$.
- **Case 2 :** If $b_k = 0$ and $c_k = 1$, then a_k must be 1 because $0 \text{ XOR } 1 = 1$.
- **Case 3 :** If $b_k = 1$ and $c_k = 0$, then a_k must be 1 because $1 \text{ XOR } 0 = 1$.
- **Case 4 :** If $b_k = 1$ and $c_k = 1$, then a_k must be 0 because $1 \text{ XOR } 1 = 0$.

In each case, the value of a_k is uniquely determined by b_k and c_k .

(b) **Answer:** No, the reconstruction property does not hold if $c_k = a_k \text{ AND } b_k$. When $b_k = 0$, regardless of a_k (whether 0 or 1), the result of $a_k \text{ AND } b_k$ is 0. Therefore, c_k would always be 0 in this case, and we cannot distinguish whether a_k was 0 or 1.

(c) **Answer:** No, the reconstruction property does not hold if $c_k = a_k \text{ OR } b_k$. When $b_k = 1$, regardless of a_k (whether 0 or 1), the result of $a_k \text{ OR } b_k$ is 1. Therefore, c_k is always 1 in this case, and a_k cannot be uniquely determined.

10. Is the statement $\exists x \forall y (xy = 0)$ true or false? The domain of discourse is the set of real numbers.

Answer: The statement $\exists x \forall y (xy = 0)$ is true. Choosing $x = 0$ gives $0 \cdot y = 0$ for every real number y .

11. If P and Q are predicates over some domain, and if it is true that $\forall x (P(x) \vee Q(x))$, must $\forall x P(x) \vee \forall x Q(x)$ also be true?

Answer: No; $\forall x (P(x) \vee Q(x))$ only means that for each x , either $P(x)$ or $Q(x)$ is true, but it does not imply that either $P(x)$ is true for all x or $Q(x)$ is true for all x .

12. Translate the formal expression $\forall x \exists y \exists z (y \neq z \wedge P(x, y) \wedge P(x, z))$ into English. Do not use symbols such as x , y , and z in your translation.

Answer: Every person has at least two distinct friends.

13. Let P be defined as in the previous problem. Is $\forall x \exists y \exists z (y \neq z \rightarrow P(x, y) \wedge P(x, z))$ true or false?

Answer: The statement $\forall x \exists y \exists z (y \neq z \rightarrow (P(x, y) \wedge P(x, z)))$ is true. By choosing y and z to be the same individual, condition $y \neq z$ is false, making the implication true regardless of any friendship relationship.

14. **(Extra Credit)** Write a Python program that prints a complete truth table for $(a \rightarrow b) \rightarrow (c \rightarrow d)$ and $(a \rightarrow (b \rightarrow c)) \rightarrow d$

```

1 def implies(p, q):
2     return (not p) or q
3
4 print("Student ID: 1217455031")
5 print(f"[ 'a':{a} ] [ 'b':{b} ] [ 'c':{c} ] [ 'd':{d} ] [ ('(a->b)->(c->d)'):{res1} ] [ ('(a->(b->c))->d'):{res2} ]")
6 print("\n")
7 for a in [False, True]:
8     for b in [False, True]:
9         for c in [False, True]:
10            for d in [False, True]:
11                expr1 = implies(implies(a, b), implies(c, d))
12                expr2 = implies(implies(a, implies(b, c)), d)
13
14                # Convert boolean values and print strings so True/False displays instead of 1/0
15                print(f"[ {str(a):6} ] [ {str(b):6} ] [ {str(c):6} ] [ {str(d):6} ] [ "
16                      f"{str(expr1):15} ] [ {str(expr2):15} ]")

```

```

$ python -u "c:\Users\BTrin\OneDrive\Desktop\ASU\IFT\Projects\WAT_243\homework_1\homework_week_1.py"
